

Chapter 137

Non-Inferiority Tests for the Ratio of Two Variances

Introduction

This procedure calculates power and sample size of *non-inferiority* tests of (total = between + within) variances from a two-group, parallel design. This routine deals with the case in which the statistical hypotheses are expressed in terms of the ratio of the variances.

Technical Details

This procedure uses the formulation given in Chow, Shao, Wang, and Lokhnygina (2018), pages 217 - 220.

Suppose x_{ij} is the response of the i th group ($i = 1, 2$) and j th subject ($j = 1, \dots, N_i$). The model analyzed in this procedure is

$$x_{ijk} = \mu_i + e_{ij}$$

where μ_i is the treatment effect and e_{ij} is the between-subject error term which is normally distributed with mean 0 and variance $V_i = \sigma_{B_i}^2$. Unbiased estimators of these variances are given by

$$\hat{V}_i = \frac{1}{N_i - 1} \sum_{j=1}^{N_i} (x_{ij} - \bar{x}_i)^2$$

$$\bar{x}_i = \frac{1}{N_i} \sum_{j=1}^{N_i} x_{ij}$$

A common test statistic to compare variabilities in the two groups is $T = \hat{V}_1 / \hat{V}_2$. Under the usual normality assumptions, T is distributed as an F distribution with degrees of freedom $N_1 - 1$ and $N_2 - 1$.

Non-Inferiority Tests for the Ratio of Two Variances

Testing Non-Inferiority

The following hypotheses are usually used to test for non-inferiority

$$H_0: \sigma_1^2/\sigma_2^2 \geq R0 \text{ versus } H_1: \sigma_1^2/\sigma_2^2 < R0,$$

where $R0$ is the non-inferiority limit.

The corresponding test statistic is $T = (\hat{V}_1/\hat{V}_2)/R0$.

Power

The power of this combination of tests is given by

$$\text{Power} = P\left(F < \left(\frac{R0}{R1}\right) F_{\alpha, N_1-1, N_2-1}\right)$$

where F is the common F distribution with the indicated degrees of freedom, α is the significance level, and $R1$ is the value of the variance ratio stated by the alternative hypothesis. Lower quantiles of F are used in the equation.

A simple binary search algorithm can be applied to this power function to obtain an estimate of the necessary sample size.

Procedure Options

This section describes the options that are specific to this procedure. These are located on the Design tab. For more information about the options of other tabs, go to the Procedure Window chapter.

Design Tab

The Design tab contains the parameters associated with this test such as sample sizes, alpha, and power.

Solve For

Solve For

This option specifies the parameter to be solved for from the other parameters. Under most situations, you will select either *Power* or *Sample Size*.

Power and Alpha

Power

This option specifies one or more values for power. Power is the probability of rejecting a false null hypothesis, and is equal to one minus Beta. Beta is the probability of a type-II error, which occurs when a false null hypothesis is not rejected.

Values must be between zero and one. Historically, the value of 0.80 (Beta = 0.20) was used for power. Now, 0.90 (Beta = 0.10) is also commonly used.

A single value may be entered here or a range of values such as *0.8 to 0.95 by 0.05* may be entered.

Non-Inferiority Tests for the Ratio of Two Variances

Alpha

This option specifies one or more values for the probability of a type-I error. A type-I error occurs when a true null hypothesis is rejected. In this procedure, a type-I error occurs when you reject the null hypothesis of non-equivalence when in fact the null hypothesis is true.

Values must be between zero and one. Historically, the value of 0.05 has been used for alpha. This means that about one test in twenty will falsely reject the null hypothesis. You should pick a value for alpha that represents the risk of a type-I error you are willing to take in your experimental situation.

You may enter a range of values such as *0.01 0.05 0.10* or *0.01 to 0.10 by 0.01*.

Sample Size (When Solving for Sample Size)

Group Allocation

Select the option that describes the constraints on $N1$ or $N2$ or both.

The options are

- **Equal ($N1 = N2$)**

This selection is used when you wish to have equal sample sizes in each group. Since you are solving for both sample sizes at once, no additional sample size parameters need to be entered.

- **Enter $N2$, solve for $N1$**

Select this option when you wish to fix $N2$ at some value (or values), and then solve only for $N1$. Please note that for some values of $N2$, there may not be a value of $N1$ that is large enough to obtain the desired power.

- **Enter $R = N2/N1$, solve for $N1$ and $N2$**

For this choice, you set a value for the ratio of $N2$ to $N1$, and then PASS determines the needed $N1$ and $N2$, with this ratio, to obtain the desired power. An equivalent representation of the ratio, R , is

$$N2 = R * N1.$$

- **Enter percentage in Group 1, solve for $N1$ and $N2$**

For this choice, you set a value for the percentage of the total sample size that is in Group 1, and then PASS determines the needed $N1$ and $N2$ with this percentage to obtain the desired power.

$N2$ (Sample Size, Group 2)

This option is displayed if Group Allocation = "Enter $N2$, solve for $N1$ "

$N2$ is the number of items or individuals sampled from the Group 2 population.

$N2$ must be ≥ 2 . You can enter a single value or a series of values.

R (Group Sample Size Ratio)

This option is displayed only if Group Allocation = "Enter $R = N2/N1$, solve for $N1$ and $N2$."

R is the ratio of $N2$ to $N1$. That is,

$$R = N2 / N1.$$

Use this value to fix the ratio of $N2$ to $N1$ while solving for $N1$ and $N2$. Only sample size combinations with this ratio are considered.

$N2$ is related to $N1$ by the formula:

$$N2 = [R \times N1],$$

where the value $[Y]$ is the next integer $\geq Y$.

Non-Inferiority Tests for the Ratio of Two Variances

For example, setting $R = 2.0$ results in a Group 2 sample size that is double the sample size in Group 1 (e.g., $N1 = 10$ and $N2 = 20$, or $N1 = 50$ and $N2 = 100$).

R must be greater than 0. If $R < 1$, then $N2$ will be less than $N1$; if $R > 1$, then $N2$ will be greater than $N1$. You can enter a single or a series of values.

Percent in Group 1

This option is displayed only if Group Allocation = "Enter percentage in Group 1, solve for $N1$ and $N2$."

Use this value to fix the percentage of the total sample size allocated to Group 1 while solving for $N1$ and $N2$. Only sample size combinations with this Group 1 percentage are considered. Small variations from the specified percentage may occur due to the discrete nature of sample sizes.

The Percent in Group 1 must be greater than 0 and less than 100. You can enter a single or a series of values.

Sample Size (When Not Solving for Sample Size)

Group Allocation

Select the option that describes how individuals in the study will be allocated to Group 1 and to Group 2.

The options are

- **Equal ($N1 = N2$)**
This selection is used when you wish to have equal sample sizes in each group. A single per group sample size will be entered.
- **Enter $N1$ and $N2$ individually**
This choice permits you to enter different values for $N1$ and $N2$.
- **Enter $N1$ and R , where $N2 = R * N1$**
Choose this option to specify a value (or values) for $N1$, and obtain $N2$ as a ratio (multiple) of $N1$.
- **Enter total sample size and percentage in Group 1**
Choose this option to specify a value (or values) for the total sample size (N), obtain $N1$ as a percentage of N , and then $N2$ as $N - N1$.

Sample Size Per Group

This option is displayed only if Group Allocation = "Equal ($N1 = N2$)."

The Sample Size Per Group is the number of items or individuals sampled from each of the Group 1 and Group 2 populations. Since the sample sizes are the same in each group, this value is the value for $N1$, and also the value for $N2$.

The Sample Size Per Group must be ≥ 2 . You can enter a single value or a series of values.

$N1$ (Sample Size, Group 1)

*This option is displayed if Group Allocation = "Enter $N1$ and $N2$ individually" or "Enter $N1$ and R , where $N2 = R * N1$."*

$N1$ is the number of items or individuals sampled from the Group 1 population.

$N1$ must be ≥ 2 . You can enter a single value or a series of values.

Non-Inferiority Tests for the Ratio of Two Variances

N2 (Sample Size, Group 2)

This option is displayed only if Group Allocation = "Enter N1 and N2 individually."

$N2$ is the number of items or individuals sampled from the Group 2 population.

$N2$ must be ≥ 2 . You can enter a single value or a series of values.

R (Group Sample Size Ratio)

*This option is displayed only if Group Allocation = "Enter N1 and R, where $N2 = R * N1$."*

R is the ratio of $N2$ to $N1$. That is,

$$R = N2/N1$$

Use this value to obtain $N2$ as a multiple (or proportion) of $N1$.

$N2$ is calculated from $N1$ using the formula:

$$N2 = [R \times N1],$$

where the value $[Y]$ is the next integer $\geq Y$.

For example, setting $R = 2.0$ results in a Group 2 sample size that is double the sample size in Group 1.

R must be greater than 0. If $R < 1$, then $N2$ will be less than $N1$; if $R > 1$, then $N2$ will be greater than $N1$. You can enter a single value or a series of values.

Total Sample Size (N)

This option is displayed only if Group Allocation = "Enter total sample size and percentage in Group 1."

This is the total sample size, or the sum of the two group sample sizes. This value, along with the percentage of the total sample size in Group 1, implicitly defines $N1$ and $N2$.

The total sample size must be greater than one, but practically, must be greater than 3, since each group sample size needs to be at least 2.

You can enter a single value or a series of values.

Percent in Group 1

This option is displayed only if Group Allocation = "Enter total sample size and percentage in Group 1."

This value fixes the percentage of the total sample size allocated to Group 1. Small variations from the specified percentage may occur due to the discrete nature of sample sizes.

The Percent in Group 1 must be greater than 0 and less than 100. You can enter a single value or a series of values.

Effect Size

R0 (Non-Inferiority Variance Ratio)

Enter one or more values for the non-inferiority limit for the ratio of the two variances. When the ratio of the sample variances is less than this value, the treatment group (group 1) is concluded to be "non-inferior" to the reference (group 2) group.

This value must be greater than one. Popular choices are 1.5 and 2.

R1 (Actual Variance Ratio)

Enter one or more values for variance ratio assumed by the alternative hypothesis. This is the value of σ_1^2/σ_2^2 at which the power is calculated.

This value should be less than $R0$ and greater than zero.

Example 1 – Finding Sample Size

A company has developed a generic drug for treating rheumatism and wants to show that it is non-inferior to the standard drug in terms of the variances. A parallel-group design will be used to test the non-inferiority.

Company researchers set the non-inferiority limit to 1.5, the significance level to 0.05, the power to 0.90, and the actual variance ratio values between 0.8 and 1.3. They want to investigate the range of required sample size values assuming that the two group sample sizes are equal.

Setup

This section presents the values of each of the parameters needed to run this example. First, from the PASS Home window, load the **Non-Inferiority Tests for the Ratio of Two Variances** procedure window. You may then make the appropriate entries as listed below, or open **Example 1** by going to the **File** menu and choosing **Open Example Template**.

<u>Option</u>	<u>Value</u>
Design Tab	
Solve For	Sample Size
Power.....	0.90
Alpha.....	0.05
Group Allocation	Equal (N1 = N2)
R0 (Non-Inferiority Variance Ratio)	1.5
R1 (Actual Variance Ratio)	0.8 0.9 1 1.2 1.3

Annotated Output

Click the Calculate button to perform the calculations and generate the following output.

Numeric Results

Actual Power	Group 1 Sample Size	Group 2 Sample Size	Non-Inferiority Variance Ratio		Actual Variance Ratio		Alpha
	N1	N2	N	R0	R1		
0.9013	89	89	178	1.500	0.800	0.050	
0.9017	134	134	268	1.500	0.900	0.050	
0.9009	211	211	422	1.500	1.000	0.050	
0.9001	690	690	1380	1.500	1.200	0.050	
0.9000	1675	1675	3350	1.500	1.300	0.050

Report Definitions

Actual Power is the actual power achieved. Because N1 and N2 are discrete, this value is usually slightly larger than the target power.

N1 is the number of subjects from group 1. Each subject is measured M times.

N2 is the number of subjects from group 2. Each subject is measured M times.

N is the total number of subjects. $N = N1 + N2$.

R0 is the non-inferiority limit for the variance ratio.

R1 is the value of the variance ratio at which the power is calculated.

Alpha is the probability of rejecting a true null hypothesis, H0.

Non-Inferiority Tests for the Ratio of Two Variances

Summary Statements

A study is being conducted to assess the non-inferiority of the variances of two groups by looking at the ratio of their variances. If the sample variance ratio falls below the non-inferiority limit, the treatment (group 1) is concluded to be 'non-inferior' to the control group. Otherwise, it is not. Group sample sizes of 89 and 89 achieve 90% power to reject the null hypothesis of inferiority at a significance level of 0.050. The non-inferiority limit is 1.500. The variance ratio at which the power is calculated is 0.800.

This report gives the sample sizes for the indicated scenarios.

Plot Section

These plots show the relationship between sample size and R1.

Non-Inferiority Tests for the Ratio of Two Variances

Example 2 – Validation using Chow *et al.* (2018)

The following example is shown in Chow *et al.* (2018) page 220.

Find the sample size when the non-inferiority limit is 1.21, the significance level to 0.05, the power is 0.8, and the alternative variance ratio value 0.5377778. They obtained $N_1 = N_2 = 40$.

Setup

This section presents the values of each of the parameters needed to run this example. First, from the PASS Home window, load the **Non-Inferiority Tests for the Ratio of Two Variances** procedure window. You may then make the appropriate entries as listed below, or open **Example 2** by going to the **File** menu and choosing **Open Example Template**.

<u>Option</u>	<u>Value</u>
Design Tab	
Solve For	Sample Size
Power.....	0.80
Alpha.....	0.05
Group Allocation	Equal (N1 = N2)
R0 (Non-Inferiority Variance Ratio)	1.21
R1 (Actual Variance Ratio)	0.5377778

Output

Click the Calculate button to perform the calculations and generate the following output.

Numeric Results						
Actual Power	Group 1 Sample Size N1	Group 2 Sample Size N2	N	Non-Inferiority Variance Ratio R0	Actual Variance Ratio R1	Alpha
0.8051	40	40	80	1.210	0.538	0.050

The sample sizes match Chow *et al.* (2018).
